Remitsheet for Mezo

Pay your whole team in MUSD, without selling your Bitcoin

One signature, one Mezo transaction, a receipt and an accounting export.

Mezo Buildathon · Wave 1 · Track 2: Access and Distribution (also fits Track 1)

The problem

Payday is many transfers

Paying 20 contractors, bounty winners or grantees means 20 transactions and 20 chances to mistype an address.

Approvals pile up

Every token payout needs an approval first, and approvals are often left unlimited long after payday.

Dollars mean selling BTC

Bitcoin treasuries sell BTC to pay in dollars, and the accountant still wants receipts and EUR values.

The solution

1

Paste a sheet

address, amount, label. Every line is checked before anything moves.

2

Sign once

One EIP-2612 permit for exactly the total, then one transaction pays everyone in MUSD, MEZO or BTC.

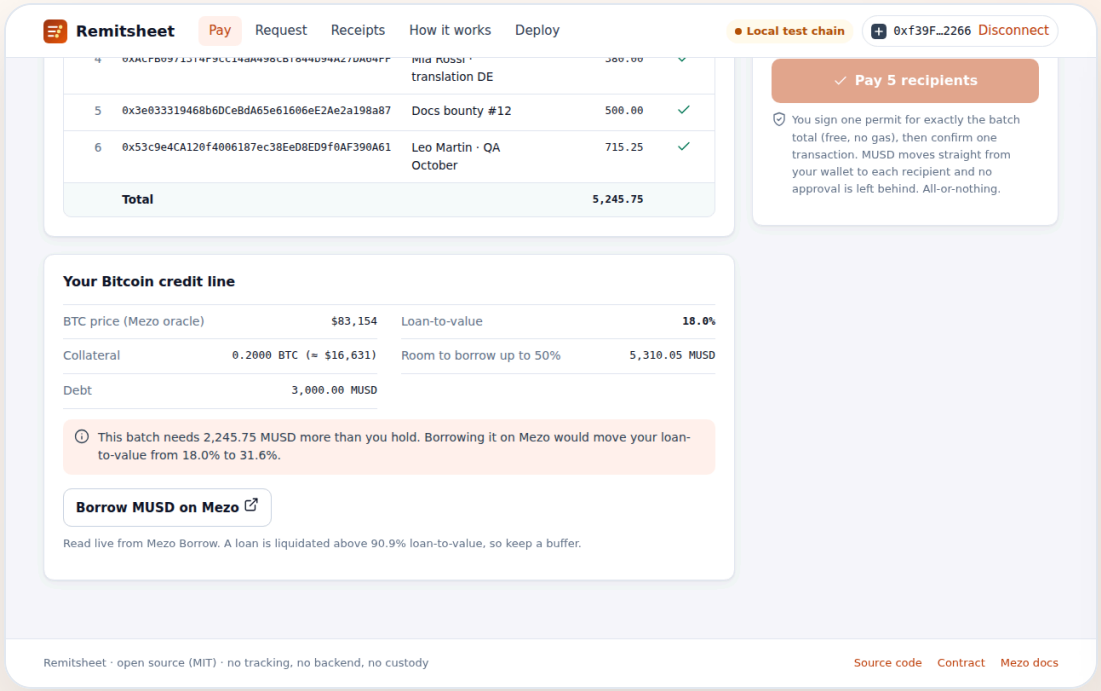

3

Keep the paperwork

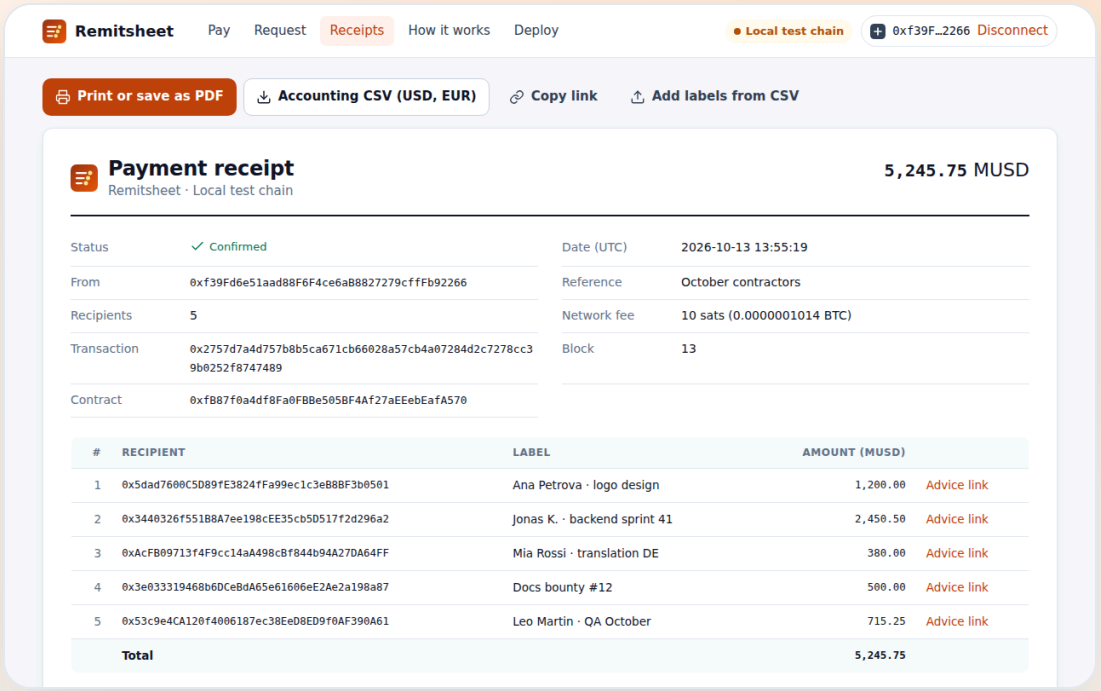

Receipt from the chain, PDF, payment advice per person, CSV with USD and EUR values.

Short on MUSD? The app reads your **Mezo Borrow** loan and shows what borrowing the gap against your BTC does to your loan-to-value, then sends you to Mezo to borrow it.

Product

Mezo Borrow credit line for a short MUSD batch

Receipt rebuilt from the chain, with USD and EUR export

How deep it goes into Mezo

MUSD	Main payout asset. EIP-2612 permit (domain "Mezo USD" v1), verified against `DOMAIN_SEPARATOR()` before signing. Valued at 1 USD.
MEZO	Grants and rewards. Mezo's precompiled token: its permit returns a bool and needs v = 27 or 28; the contract handles both permit styles.
BTC	Native payouts down to the satoshi; fees shown in sats.
Mezo Borrow	Live reads of `TroveManager`, `PriceFeed` and `BorrowerOperations`: collateral, debt, loan-to-value, room to borrow, fee-inclusive effect of borrowing the shortfall.
PriceFeed history	BTC lines and the network fee are valued at Mezo's BTC/USD price at the payment block.
Request links	Contractors send a link with address, amount and asset; payers collect them into one batch.

Built to be used, not just demoed

Contract

- No owner, no fees, no upgrades, holds no funds
- All-or-nothing batches
- Permit owner is always the caller; a front-run permit cannot break or hijack a batch
- Same CREATE2 address on Mezo testnet and mainnet

Tested

- 49 Foundry tests: unit, fuzz, permit, reentrancy, failing tokens
- 27 unit tests (sheet checks, money math, credit line, request links)
- 44 end-to-end browser checks on a local chain
- 200 lines fit in one Mezo block: at most about 1,100 sats

Who it is for

Users

- Bitcoin-holding startups, studios and DAOs paying contractors in dollars
- Grant and bounty programs paying many winners in MEZO or MUSD
- Freelancers who send request links instead of addresses in a chat
- Desktop web, any EIP-6963 wallet, worldwide

Why it grows MUSD

- Every payroll run moves MUSD to people who may never have held it
- Each request link brings a new payer to Mezo
- Borrowing for payroll is recurring MUSD demand
- Business model: free open-source core, paid team features later (schedules, approvals, accounting connectors)

Next milestones

Wave 2 · by 15 Nov

Borrow-and-pay in one transaction with `withdrawMUSDWithSignature` (BorrowerOperationsSignatures), Mezo Passport for Bitcoin wallets, mainnet deployment.

December

Recurring payroll schedules, Safe multisig approvals, saved recipient lists.

Q1 2027

Accounting connectors and invoice import, hosted team plan.
